

Injections

What is an Injection?

Injection is a command or series of commands added to the program while the program is running. Instead of changing the program by a programmer, the program has a window allowing to get external command that are executed based in the injection command. VRP uses injection only for POS scanning.

Adding injection to VRP.

VRP's setup allows to build queries for injection using the "Injection Builder" from the setup window.

24 Company URL	http://omn.com	Company Web Site Address	UPS	<input type="checkbox"/>	<input type="checkbox"/>	Alphanumeric
25 Attention Title	president	Title of Contact Person	UPS	<input type="checkbox"/>	<input type="checkbox"/>	Alphanumeric
26 email	omni@gmail.com	Email Address of Contact Person	UPS	<input type="checkbox"/>	<input type="checkbox"/>	Alphanumeric

The screenshot shows a software interface with a grid of buttons. The 'Injection Builder' button is circled in red. Other buttons include 'VIC Admin', 'Select Value', 'Credit Cards', 'Address', 'V mode', 'Find', 'Advanced', 'Policy Editor', 'C Test Values', 'Global Setup', 'Registers Version', 'Update Stores', 'Upgrade Notification', 'IP Addresses', 'Copy Register Setup to a New Register', 'Fix Descs', 'Validate', 'Public', 'Do Not Terminate List', and 'Bye Bye'. There is also a search area at the bottom left with options for 'By Store' and 'By Register'.

The system starts with injection #1. You can name the injection for your own reference, the name is not used during the injection process.

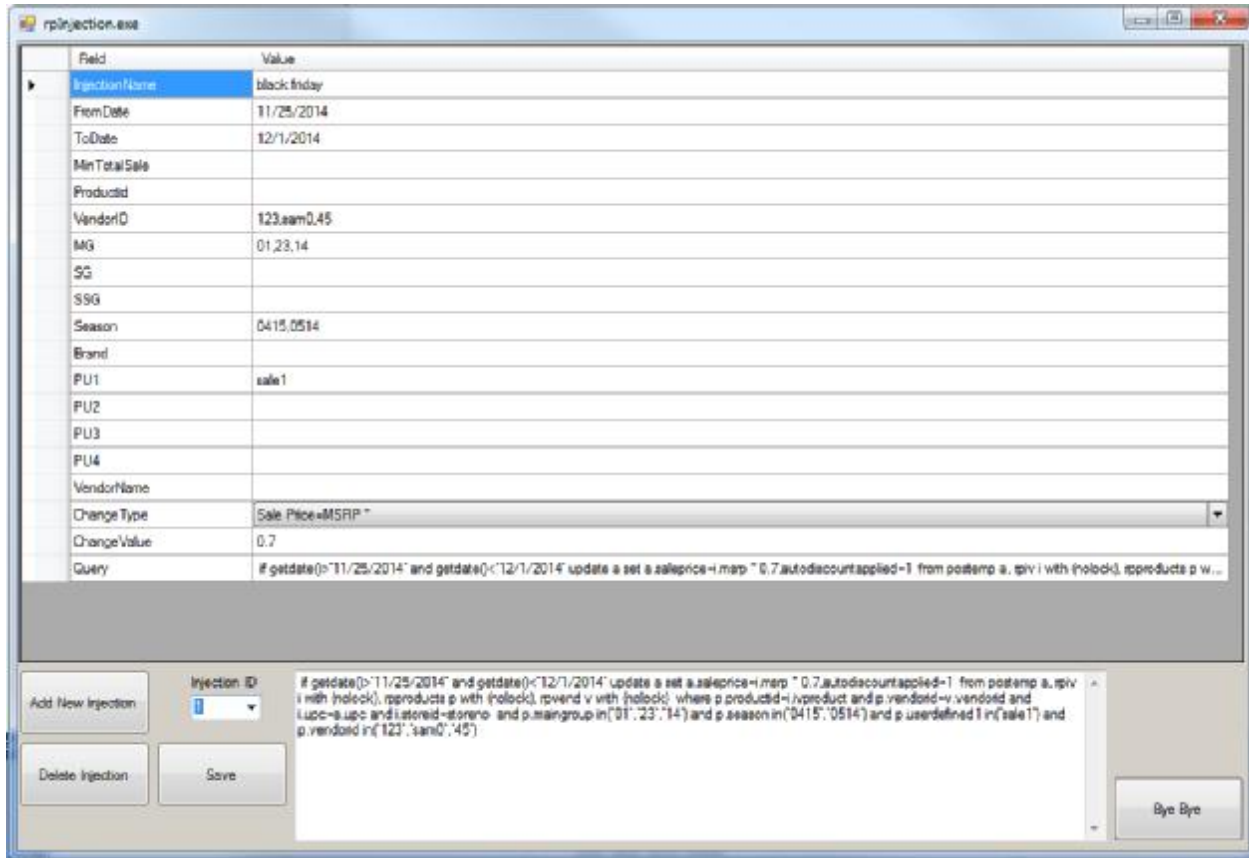

Fill in the fields, allowing multiple selection using comma to separate. For example, if you enter for MG the value "01,23,14" the injection will apply only to main groups 01, 23 and 14.

You can also limit the time period for the injection or specify minimum total sale amount before discount for the injection to work.

There are 2 mandatory fields:

1. Change Type, must be selected from the drop down.
2. Change Value. That is the value entered for the calculation.

Upon save, the injection setup is saved.

To add a new injection, click add new injection.

To create your own injection, without using the builder, enter 0 in the injection ID drop box, enter the query text and click save. Injection 0 will ignore all entered fields in the table above.

You can setup as many injections as you like.

Setting up VRP to use selected injections

In setup look for Injection, and enter all the injection IDs separated by commas. VRP will execute the injection commands before any calculation is made.
